## **DETAILED ACTION**

### ***Response to Amendment***

Applicant's request for reconsideration of the finality of the rejection of the last Office action is persuasive and, therefore, the finality of that action is withdrawn.

### ***Claim Objections***

Claim 13 is objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim. Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form. Claim 1 already recites that a thermoplastic elastomer makes up to mantle layer.

### ***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 13 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 13 recites the limitation "the thermoplastic resin" in line 1. There is insufficient antecedent basis for this limitation in the claim.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and

Art Unit: 3711

the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1 and 6-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Higuchi et al. (JP 11-253578).

Higuchi et al. discloses a golf ball having favorable carrying characteristics, soft feeling, and excellent spin characteristics. The golf ball comprises a solid core, intermediate layer, and cover. The solid core has a diameter of 28 or more, a deflection (compression) of 3.2 to 5.2mm from applying a load of 130kg to 10kg, and Shore D hardness on the front face of 30 to 55. The specific gravity of the core is less than 1.3. It is noted that the difference of a point measured at random and the front face should be no more than 10 degrees. The intermediate layer is formed of a polyurethane resin as the main material, in which contains a thermoplastic polyurethane elastomer. It is also noted that the polyurethane may be blended with materials such as polyamide, polyester, ionomer, etc. The cover has a Shore D hardness of 45 to 68. Higuchi et al. notes that polyester was used to produce the polyurethane of the intermediate layer. The intermediate layer also has a Shore D hardness of 20 to 50, a thickness of 0.5 to 2.5mm, a specific gravity of 1.1 or more, and a deflection (compression) of 3.2 to 5.2mm from applying a load of 130 kg to 10kg. One having ordinary skill in the art would have found it obvious to have a ratio between the compression of the core and intermediate layer of any value, in particular approximately 1, as taught by Higuchi et al., in order to obtain a golf ball having good feel and flight distance.

### ***Response to Arguments***

Applicant's arguments with respect to claims 1 and 6-18 have been considered but are moot in view of the new ground(s) of rejection.
